## 0.2 Exponential Functions

**Preview Activity 0.2.** Suppose that the populations of two towns are both growing over time. The town of Exponentia is growing at a rate of 2% per year, and the town of Lineola is growing at a rate of 100 people per year. In 2014, both of the towns have 2,000 people.

- (c) What percent of the substance is present after 10 days?

**Activity 0.7.**

Uncontrolled geometric growth of the bacterium *Escherichia coli* (*E. Coli*) is the theme of the following quote taken from the best-selling author Michael Crichton's science fiction thriller, *The Andromeda Strain*:

“The mathematics of uncontrolled growth are frightening. A single cell of the bacterium *E. coli* would, under ideal circumstances, divide every twenty minutes. That is not particularly disturbing until you think about it, but the fact is that that bacteria multiply geometrically: one becomes two, two become four, four become eight, and so on. In this way it can be shown that in a single day, one cell of *E. coli* could produce a super-colony equal in size and weight to the entire planet Earth.”

- (a) Write an equation for the number of *E. coli* cells present if a single cell of *E. coli* divides every 20 minutes.
- (b) How many *E. coli* would there be at the end of 24 hours?
- (c) The mass of an *E. coli* bacterium is  $1.7 \times 10^{-12}$  grams, while the mass of the Earth is  $6.0 \times 10^{27}$  grams. Is Michael Crichton's claim accurate? Approximate the number of hours we should have allowed for this statement to be correct?

## 0.3 Transformations of Functions

The values of A, B, C, and D are constants and the function  $f(x)$  will be henceforth called the *parent function*. To facilitate this exploration, use the applet located at <http://www.geogebraTube.org/student/m93018>.

- (a) Let's start with a simple parent function:  $f(x) = x^2$ .

## 0.4 Logarithmic Functions

**Preview Activity 0.4.** Carbon-14 ( $^{14}\text{C}$ ) is a radioactive isotope of carbon that occurs naturally in the Earth's atmosphere. During photosynthesis, plants take in  $^{14}\text{C}$  along with other carbon isotopes, and the levels of  $^{14}\text{C}$  in living plants are roughly the same as atmospheric levels. Once a plant dies, it no longer takes in any additional  $^{14}\text{C}$ . Since  $^{14}\text{C}$  in the dead plant decays at a predictable rate (the half-life of  $^{14}\text{C}$  is approximately 5,730 years), we can measure  $^{14}\text{C}$  levels in dead plant matter to get an estimate on how long ago the plant died. Suppose that a plant has 0.02 milligrams of  $^{14}\text{C}$  when it dies.

- (a) Write a function that represents the amount of  $^{14}\text{C}$  remaining in the plant after  $t$  years.
- (b) Complete the table for the amount of  $^{14}\text{C}$  remaining  $t$  years after the death of the plant.

$t$	0	1	5	10	100	1000	2000	5730
$^{14}\text{C}$ Level	0.02							

- (c) Suppose our plant died sometime in the past. If we find that there are 0.014 milligrams of  $^{14}\text{C}$  present in the plant now, estimate the age of the plant to within 50 years.

## 0.5 Trigonometric Functions

**Preview Activity 0.5.** A tall water tower is swaying back and forth in the wind. Using an ultrasonic ranging device, we measure the distance from our device to the tower (in centimeters) every two seconds with these measurements recorded below.

Time (sec)	0	2	4	6	8	10	12	14	16	18	20
Distance (cm)	30.9	23.1	14.7	12.3	17.7	26.7	32.3	30.1	21.8	13.9	12.6

- (a) Use the coordinate plane below to create a graph of these data points.

- (b) What is the water tower's maximum distance away from the device?
- (c) What is the smallest distance measured from the tower to the device?
- (d) If the water tower was sitting still and no wind was blowing, what would be the distance from the tower to the device? We call this the tower's equilibrium position.
- (e) What is the maximum distance that the tower moves away from its equilibrium position? We call this the amplitude of the oscillations.
- (f) How much time does it take the water tower to sway back and forth in a complete cycle? We call this the period of oscillation.

**Activity 0.16.**

In this activity we will review the trigonometry of the special angles  $0^\circ$ ,  $30^\circ$ ,  $45^\circ$ , and their multiples.

- (a) Use the fact that  $180^\circ$  is the same as  $\pi$  radians, convert each of the following angle measurements to radians.

Degrees	$0^\circ$	$30^\circ$	$45^\circ$	$60^\circ$	$90^\circ$	$120^\circ$	$135^\circ$	$150^\circ$	$180^\circ$
Radians	0								$\pi$
Degrees	$210^\circ$	$225^\circ$	$240^\circ$	$270^\circ$	$300^\circ$	$315^\circ$	$330^\circ$	$360^\circ$	
Radians									

- (b) In part (a) of this problem there are several patterns that can help in remembering the radian conversions for certain angles. For example, you should have found that  $30^\circ$  converts to  $\frac{\pi}{6}$  radians. Therefore,  $60^\circ$  should be twice  $\frac{\pi}{6}$  which indeed it is:  $60^\circ = \frac{\pi}{3}$  radians. What other similar patterns can you find? What is the minimum number of radian measures that you need to memorize?
- (c) The sides of a 30–60–90 triangle follow well-known ratios. Consider the equilateral triangle on the left of the figure below. Fill in the rest of the sides and angles on the figure and use them to determine the trigonometric values of  $30^\circ$  and  $60^\circ$ .

Angle (degrees)	Angle (radians)	Sine	Cosine	Tangent
$30^\circ$				
$60^\circ$				

- (d) The sides of a 45–45–90 triangle also follow well-known ratios. Consider the isosceles triangle on the right of the figure below. Fill in the rest of the sides and angles on the figure and use them to determine the trigonometric values of  $45^\circ$ .

Angle (degrees)	Angle (radians)	Sine	Cosine	Tangent
$45^\circ$				

- (e) Finally, we can organize all of the information about the special right triangles on a well-known organizational tool: the unit circle. The  $x$  coordinate of each point is the cosine of the angle and the  $y$  coordinate of each point is the sine of the angle.
